Grade 10 – Term 1
Interactive Decision Webpage: C10 Practice

Create and deploy an **individual interactive decision webpage** based on a realistic economic or financial scenario. Use the **C10 reference dashboard** as the functional model and independently apply your learning from C1–C9.

Requirements

1. **Scenario and interactive model.** Present the decision context and editable payoff data. Include results for **Maximax, Maximin, Minimax Regret, and EMV/Bayes**, staged filtering, and a corresponding flow diagram.
2. **C10 evaluation.** Independently select and justify the most appropriate criterion for your scenario, considering the available information, objectives, risk attitude, and constraints. Interpret its recommendation, distinguish it from the staged-filtering outcome, and discuss limitations and sensitivity to changes in assumptions. Include this analysis on the webpage.
3. **References and AI conversations.** Cite the sources used for your scenario and financial data, and identify your assumptions. Include a visible AI development record with accessible links to the AI conversations used.
4. **Submission.** Submit the **deployed webpage URL** and the **GitHub repository URL**, both accessible to the teacher.

Ensure the webpage is accurate, functional, and easy to use.
